

Program administrators and implementers: Use this sample design as a starting point to provide customers that have gone through your ISO 50001 based SEM program recognition of their Energy Management System.

Benefits:

1. Provide industrial and large commercial customers with recognition of their EnMS from US DOE without having to go through an external audit or certification process.
2. Stand-alone "do it yourself" solution that customers can follow without utility or implementer support.
3. Leverage DOE's world-class resources to create value for customers while minimizing program development and implementation costs.

This sample design is based on US DOE's award-winning 50001 Ready Navigator, an online guide to establish or enhance an energy system, and is supported by a variety of tools and resources publicly available from US DOE.

Sample Design:

In this design, customers who have completed or are nearing completion of an ISO 50001-based SEM program are provided with an overview of the advantages of being recognized by the 50001 Ready program and the tools and support available to the customer, including how to use 50001 Ready Navigator. Customers can then use Navigator to track their progress and self-attest their completion.
