ENERSYS:

Using Lean Management to Reduce Energy, Water, and Material Waste

The EnerSys Operating System (EOS) lean program facilitates organizational change by fostering employee-driven opportunities at each plant, achieving energy savings, cost savings, reducing waste, reducing CO₂ emissions and addressing other important environmental impacts.

- ✔ Engaged staff to reduce scrap from the production process, optimize energy use, and increase water reuse and recycling
- ✔ Increased employees buy-in and accountability by posting daily improvement boards that display opportunities for improvement at the plant and machine-level
- ✔ Marked waste reduction opportunities with tags on the plant floor, indicating they will be addressed within a 10-day timeframe and fostering a culture of continuous improvement
